Femto-TA experiments involve two femtosecond laser pulses (see Fig. 1 and Fig. 3 for an overview of the method): a monochromatic energetic pump pulse ( $I_p$ ) which triggers the studied photoreaction and a weak (broad or monochromatic) probe pulse ( $I_{probe}$ ). The pump pulse, which goes through a certain volume of the sample, is resonant with an electronic transition of the photosystems of interest.

Capacitive Deionization (CDI) has emerged over the years as a robust, energy efficient, and cost effective technology for desalination of water with a low or moderate salt content. The energy efficiency of CDI for water with a salt concentration below approximately 10 g/L is due to the fact that the salt ions, which are the minority compound in the water, are removed from the mixture.
