Based on a new classification of algorithm design techniques and a clear delineation of analysis methods Mon, 14 Jan 2019 04:24:00 GMT Introduction to the Design and Analysis of Algorithms ... - In computer science, divide and conquer is an algorithm design paradigm based on multi-branched recursion. A divide-and-conquer algorithm works by recursively breaking down a problem into two or more sub-problems of the same or related type, until these become simple enough to be solved directly. The solutions to the sub-problems are then combined to give a solution to the original problem. Mon, 14 Jan 2019 14:18:00 GMT Divide-and-conquer algorithm - Wikipedia - Overview. NP-complete problems are in NP, the set of all decision problems whose solutions can be verified in polynomial time; NP may be equivalently defined as the set of decision problems that can be solved in polynomial time on a non-deterministic Turing machine. A problem p in NP is NP-complete if every other problem in NP can be transformed (or reduced) into p in polynomial time.
