Tue, 15 Jan 2019 17:08:00 GMT Application Note AN098 - TI.com - A transformer is a static electrical device that transfers electrical energy between two or more circuits. A varying current in

one coil of the transformer produces a varying magnetic flux, which, in turn, induces a varying electromotive force across a second coil wound around the same core. Electrical energy can be transferred between the two coils, without a metallic connection between the ... It consists of at least these components: An antenna in which electric currents are induced by radio waves.; A resonant circuit (tuned circuit) which selects the frequency of the desired radio station from all the radio signals received by the antenna. The tuned circuit consists of a coil of wire (called an ... Mon, 14 Jan 2019 15:01:00 GMT Crystal radio - Wikipedia - All dimensions are in μm /inch unless otherwise stated.
