Principles Of Distributed Database Systems

A distributed database is a database in which not all storage devices are attached to a common processor. It may be stored in multiple computers, located in the same physical location; or may be dispersed over a network of interconnected computers. Unlike parallel systems, in which the processors are tightly coupled and constitute a single database system, a distributed database system ...

In distributed systems, there can be many servers of a particular type, e.g., multiple file servers or multiple network name servers. The term service is used to denote a set of servers of a particular type. We say that a binding occurs when a process that needs to access a service becomes associated with a particular server which provides the service.
