Executor is an interface that represents an object that executes provided tasks. It depends on the particular implementation (from where the invocation is initiated) if the task should be run on a new or current thread. Hence, using this interface, we can decouple the task execution flow from the ...

Concurrent computing is a form of computing in which several computations are executed during overlapping time periods—concurrently—instead of sequentially (one completing before the next starts). This is a property of a system—this may be an individual program, a computer, or a network—and there is a separate execution point or "thread of control" for each computation ("process").

Definition Imperative programming. In imperative programming and software development, an incremental compiler is one that when invoked, takes only the changes of a known set of source files and updates any corresponding output files (in the compiler's target language, often bytecode) that may already exist from previous compilations. By effectively building upon previously compiled output ...
